

INTAK

PRODUCT INFORMATION

C.P.A.S

Conventional Public Address System

Non emergency public address systems

When a public address system is required that is not being used for evacuation of a building or facility INTAK can offer a solution to any project requirement.

A range of products are available to ensure all client requirements are met or exceeded.

Full centralised rack systems can be provided, using much of the same components as the INTAK voice evacuation system. In addition INTAK manufacture a one box fully self contained public address system (I.P.S.06) for smaller applications.

Central rack option

When using a 19" rack cubicle based format the system is assembled in a similar way to the INTAK C.V.A.S. (centralized voice alarm system) the main difference being the omission of the master card frame and battery back up.

This central rack houses all the required control and amplification equipment, and if required background music sources such as CD players and radio tuners.

Five INTAK power amplifiers are available, including 200w, 350w, 500w, 1200w, and 2000w models.

The rack will also include the ZRM (zone routing matrix), power supply chassis, loudspeaker output termination modules, and control panel.

I.P.S.06 (Integrated paging system) Option

This is a standard INTAK product which comprises a compact wall mountable enclosure which houses a 150 watt power amplifier, zone router, output module, single message store, and power supply. The unit allows six zone operation from three microphones or music sources as well as broadcast from a single message store.
