

## Field cable requirements

Generally each project is unique with a certain number of remote fire telephone outstations. For maximum security each fire telephone should be wired back to the master exchange separately. As the Firetalk 350 system uses only a single core cable and the earth return a two core cable is required per fire telephone. If a compromise is required between system security and cost a multi-core cable could be used feeding a number of fire telephones.

## Additional master control panels

Full function control panels can be fitted to the system

## Intercom interfacing

The Firetalk 350 fire telephone system can be combined with the INTAK I.V.I.S. disabled refuge intercom to form a single dual purpose life safety communication system.
